

## Native Human α-2 Antiplasmin

Cat. No. NATE-0011

Lot. No. (See product label)

## Introduction

**Description** Alpha 2-antiplasmin (or  $\alpha$ 2-antiplasmin or plasmin inhibitor) is a serine protease inhibitor (serpin)

responsible for inactivating plasmin, an important enzyme that participates in fibrinolysis and degradation

of various other proteins. This protein is encoded by the SERPINF2 gene.

**Synonyms** Alpha-2 Antiplasmin; α2-antiplasmin; plasmin inhibitor; SERPINF2; A2AP; AAP; ALPHA-2-PI; API; PLI

## **Product Information**

**Species** Human

**Source** Human Plasma

**Form** Lyophilized

Molecular

63-70 kDa

Weight

**Purity** > 95% (SDS-PAGE)

**Specificity** > 5 IU/mg

**Pathway** Blood Clotting Cascade, organism-specific biosystem; Complement and Coagulation Cascades, organism-

specific biosystem; Complement and coagulation cascades, organism-specific biosystem; Complement and coagulation cascades, conserved biosystem; Dissolution of Fibrin Clot, organism-specific biosystem; Hemostasis, organism-specific biosystem; Platelet activation, signaling and aggregation, organism-specific

biosystem

**Function** endopeptidase inhibitor activity; eukaryotic cell surface binding; protease binding; protein binding; protein

homodimerization activity; serine-type endopeptidase inhibitor activity; serine-type endopeptidase

inhibitor activity; serine-type endopeptidase inhibitor activity

## Storage and Shipping Information

**Storage** -20°C

**Tel:** 1-631-562-8517 1-516-512-3133 **Email:** info@creative-enzymes.com
