

## **T4** β-glucosyltransferase, Recombinant

Cat. No. NATE-0773

Lot. No. (See product label)

## Introduction

**Description** In enzymology, a DNA beta-glucosyltransferase is an enzyme that catalyzes the chemical reaction in

which a beta-D-glucosyl residue is transferred from UDP-glucose to an hydroxymethylcytosine residue in DNA. It is analogous to the enzyme DNA alpha-glucosyltransferase. This enzyme belongs to the family of

glycosyltransferases, specifically the hexosyltransferases.

Applications Useful for the differentiation of hydroxymethylcytosine (HMC) from methylcytosine in DNA, via

glucosylating HMC and protecting HMC from endonuclease cleavage.

Synonyms T4 Beta-glucosyltransferase; DNA beta-glucosyltransferase; T4-HMC-beta-glucosyl transferase; T4-beta-

glucosyl transferase; T4 phage beta-glucosyltransferase; UDP glucose-DNA beta-glucosyltransferase;

uridine diphosphoglucose-deoxyribonucleate beta-glucosyltransferase

## **Product Information**

**Source** E. coli

Form aqueous solution, Formulated in 200 mM imidazole and 20% glycerol.

Molecular

mol wt 41.6 kDa

Weight

Purity > 83% (SDS-PAGE)

## Storage and Shipping Information

*Storage* −70°C
