

## Native Protein Methylase II

Cat. No. NATE-0895

Lot. No. (See product label)

### Introduction

**Description** Methylation of proteins is one of the key reactions in the post-translational modification of protein amino acid residues in the cell. It has been established that the basic and acidic amino acid residues of certain proteins are methylated in vivo. Protein methylase II methylates the free carboxyl groups of dicarboxylic acid residues in a protein molecule. Existence of this enzyme, in mammalian tissues, was first reported by Liss and Edelstein. Protein methylase II from ox brain has been purified by Iqbal and Steenson.

**Synonyms** S-adenosylmethionine:protein Carboxyl O-methyltransferase; EC 2.1.1.24; Protein Methylase II

### Product Information

**EC Number** EC 2.1.1.24

**Unit Definition** The amount of enzyme which incorporates one picomole of methyl-<sup>14</sup>C into a substrate protein per minute at 37°C, pH 6.2.
