

Native Rabbit Lactate Dehydrogenase

Cat. No. DIA-268

Lot. No. (See product label)

Introduction

Description A lactate dehydrogenase (LDH or LD) is an enzyme found in nearly all living cells (animals, plants, and

prokaryotes). LDH catalyzes the conversion of pyruvate to lactate and back, as it converts NADH to NAD+ and back. A dehydrogenase is an enzyme that transfers a hydride from one molecule to another.

Synonyms Lactate dehydrogenase; EC 1.1.1.27; LDH; LD

Product Information

Species Rabbit

Source Rabbit Muscle

EC Number EC 1.1.1.27

CAS No. 9001-60-9

Molecular

140 kDa

Weight

Activity > 250 units per mg protein

Composition Lovell and Winzor (1974) report that the tetramer dissociates completely into two dimers (molecular

weight 70,000) in acetate-chloride buffer pH 5 (conditions without effect on beef heart LDH). Phosphate and pyridine nucleotides stabilize the quarternary structure of the tetramer. Phosphate has an activation

effect. See also Cho and Swainsgood (1973).

Unit

One Unit oxidizes one micromole of NADH per minute at 25°C, pH 7.3
