

## Native Aeromonas proteolytica Aminopeptidase

Cat. No. NATE-0071

Lot. No. (See product label)

## Introduction

- **Description**Aminopeptidase from Aeromonas proteolytica is a metalloenzyme, which contains 2 atoms of Zn2+ in a<br/>single polypeptide with an approximate molecular weight of 29.5 kDa as determined by sedimentation.<br/>This enzyme has a high degree of stability, being stable even at tempeRatures of 70°C for several hours.<br/>Partial inactivation occurs in 8 M urea. Maximum stability and activity are between pH 8.0-8.5.<br/>Aminopeptidase from Aeromonas proteolytica can function as an esterase.
- **Applications**Aminopeptidases are a family of widely distributed proteases, which may be used to study many<br/>significant biological processes such as protein maturation, hormone production, and peptide digestion.<br/>The enzyme has been used to measure the kinetic rate constant for the binding of bestatin, a general<br/>protease inhibitor, to aminopeptidase.

Synonyms Aminopeptidase; 37288-67-8; EC 3.4.11.10; Aeromonas proteolytica aminopeptidase

## **Product Information**

Source	Aeromonas proteolytica
Form	lyophilized powder, 50-150 units/mg protein
EC Number	EC 3.4.11.10
CAS No.	37288-67-8
Optimum pH	8.0-8.5
Composition	Protein, ~40% biuret
Specificity	Catalyzes the release of an N-terminal amino acid, preferentially leucine, but not glutamic or aspartic acids.
Buffer	Dissolves in water at 0.9-1.1 mg/mL concentration to form a clear, colorless solution.
Storage and Shipping Information	

Storage -20°C
