

proton-translocating NAD(P)+ transhydrogenase

Cat. No. EXWM-1578

Lot. No. (See product label)

Introduction

Description The enzyme is a membrane bound proton-translocating pyridine nucleotide transhydrogenase that

couples the reversible reduction of NADP by NADH to an inward proton translocation across the membrane. In the bacterium Escherichia coli the enzyme provides a major source of cytosolic NADPH. Detoxification of reactive oxygen species in mitochondria by glutathione peroxidases depends on NADPH

produced by this enzyme.

Synonyms pntA (gene name); pntB (gene name); NNT (gene name)

Product Information

Form Liquid or lyophilized powder

EC Number EC 7.1.1.1 (Formerly EC 1.6.1.5)

Reaction NADPH + NAD+ + H+[side 1] = NADP+ + NADH + H+[side 2]

Notes This item requires custom production and lead time is between 5-9 weeks. We can custom produce

according to your specifications.

Storage and Shipping Information

Store it at +4 °C for short term. For long term storage, store it at -20 °C∼-80 °C.
