

Native Microorganisms Nucleoside Phosphorylase

Cat. No. NATE-0606

Lot. No. (See product label)

Introduction

Description

In enzymology, a purine-nucleoside phosphorylase (EC 2.4.2.1) is an enzyme that catalyzes the chemical reaction:purine nucleoside + phosphate↔ purine + alpha-D-ribose 1-phosphate. Thus, the two substrates of this enzyme are purine nucleoside and phosphate, whereas its two products are purine and alpha-D-ribose 1-phosphate. This enzyme belongs to the family of glycosyltransferases, specifically the pentosyltransferases. This enzyme participates in 3 metabolic pathways:purine metabolism, pyrimidine metabolism, and nicotinate and nicotinamide metabolism.

Applications

Nucleoside phosphorylase is used in coupled enzyme systems to measure protein dephosphorylation. This enzyme is useful for enzymatic determination of inorganic phosphorus, 5'-nucleotidase and adenosine deaminase when coupled with xanthine oxidase (XTO-212) and uricase (UAO-201, UAO-211). Purine nucleoside phosophorylase has shown the ability to perform both phosphorylosis and synthesis of purine deoxy-and ribonucleosides. It has also been found that membrane-ass ociated nucleoside phosphorylases may have a transmembranal orientation with their base and ribose-1-P binding sites on opposite sides of the membrane.

Synonyms

purine-nucleoside phosphorylase; inosine phosphorylase; PNP; PNPase; PUNPI; PUNPII; inosine-guanosine phosphorylase; nucleotide phosphatase; purine deoxynucleoside phosphorylase; purine deoxyribonucleoside phosphorylase; purine nucleoside phosphorylase; purine ribonucleoside phosphorylase; 9030-21-1; EC 2.4.2.1

Product Information

Source Microorganisms

Form Lyophilized powder containing potassium gluconate, mannitol and EDTA

EC Number EC 2.4.2.1

CAS No. 9030-21-1

Molecular Weight mol wt ~120 kDa

A attacks

Activity > 10 units/mg protein

Isoelectric

pH Stability

4.1 +/-0.1

point

pH 6.0-9.0 (30°C, 16hr)

Optimum pH 7.5-8.0

Thermal

below 60°C (pH 7.7, 30min)

stability

Optimum 65°C

temperature

6.4 x 10-5M (Inosine), 3.2x10-4M (Pi)

Michaelis Constant

Inhihitors n-Chloromercurihenzoate SDS Ha++ Aa+

p emoramereumenzoate, 353, rig r r, Ag r

 ${\it Unit}$ One unit will cause the phosphorolysis of 1.0 μ mole of inosine to hypoxanthine and ribose 1-phosphate

Definition per min at pH 7.4 at 25°C.

Storage and Shipping Information

Storage −20°C

Tel: 1-631-562-8517 1-516-512-3133
