

## Native Abalone Sulfatase

Cat. No. NATE-0685

Lot. No. (See product label)

### Introduction

#### Description

Sulfatases EC 3.1.6.1 are enzymes of the esterase class that catalyze the hydrolysis of sulfate esters. These may be found on a range of substrates, including steroids, carbohydrates and proteins. Sulfate esters may be formed from various alcohols and amines. In the latter case the resultant N-sulfates can also be termed sulfamates. Sulfatases play important roles in the cycling of sulfur in the environment, in the degradation of sulfated glycosaminoglycans and glycolipids in the lysosome, and in remodelling sulfated glycosaminoglycans in the extracellular space. Together with sulfotransferases, sulfatases form the major catalytic machinery for the synthesis and breakage of sulfate esters.

#### Applications

Sulfatase from abalone entrails has been used in a study to determine that human p-selectin glycoprotein ligand-1 interacts with the skin-associated chemokine CCL27 via sulfated tyrosines at the PSGL-1 amino terminus. Sulfatase from abalone entrails has also been used in a study to investigate HPLC of sulfate and glutathione conjugates from hamster embryo fibroblasts.

#### Synonyms

EC 3.1.6.1; 9016-17-5; sulfatase; nitrocatechol sulfatase; phenolsulfatase; phenylsulfatase; p-nitrophenyl sulfatase; arylsulfohydrolase; 4-methylumbelliferyl sulfatase; estrogen sulfatase; arylsulfatase

### Product Information

#### Species

Abalone

#### Source

Abalone entrails

#### Form

lyophilized powder

#### EC Number

EC 3.1.6.1

#### CAS No.

9016-17-5

#### Activity

20-40 units/mg solid

#### Unit Definition

One unit will hydrolyze 1.0  $\mu$ mole of p-nitrocatechol sulfate per hr at pH 5.0 at 37°C (30 min assay).

### Storage and Shipping Information

#### Storage

-20°C
