

## **Native Porcine Colipase**

Cat. No. NATE-0144

Lot. No. (See product label)

## Introduction

**Description** Colipase is a protein co-enzyme required for optimal enzyme activity of pancreatic lipase. It is secreted

by the pancreas in an inactive form, procolipase, which is activated in the intestinal lumen by trypsin. Its function is to prevent the inhibitory effect of bile salts on the lipase-catalyzed intraduodenal hydrolysis of dietary long-chain triglycerides. In humans, the colipase protein is encoded by the CLPS

gene.

**Applications** Pancreatic colipase is a required co-factor for pancreatic lipase, being necessary for its activity during

hydrolysis of dietary triglycerides in the presence of bile salts

**Synonyms** CLPS; colipase; pancreatic colipase

## **Product Information**

**Species** Porcine

**Source** Porcine pancreas

Appearance Colourless liquid

**Form** Liquid

**Activity** 10 KU-20 KU/mL

**Concentration** 0.15-0.52 mg/mL

**Contaminants** Glucose Oxidase < 0.002 U/mg liquid

Pathway Digestion of dietary lipid, organism-specific biosystem; Fat digestion and absorption, organism-specific

biosystem; Lipid digestion, mobilization, and transport, organism-specific biosystem

**Function** enzyme activator activity

**Unit** One unit of activity is defined as the amount of enzyme that will catalyze the release of 1.0 micromole

**Definition** of fatty acid from tributyrin per minute at 20°C under the standard assay method conditions.
