Creative Enzymes®

Thymus Powder (porcine)

Cat. No. PTP-010

Lot. No. (See product label)

Introduction

Description

Thymus is a small glandular organ that is situated behind the top of the breastbone, consisting mainly of lymphatic tissue and serving as the site of T cell differentiation. The thymus increases gradually in size and activity until puberty, undergoing involution thereafter. These days there are many factors that can lower our immune system efficiency and make us more susceptible to all forms of diseases: intake of alcohol, smoking, many prescription drugs, high cholesterol levels, excessive sugar consumption, allergies, food additives and stress. Double-blind studies reveal that orally administered Thymus Extracts are not only able to effectively eliminate infection but that treatment over the course of a year significantly reduces the number of infections and improves numerous immune parameters.

Product Information

Form

Lyophilized powder

Storage and Shipping Information

Storage

Should be stored in original and tight containers at room temperature (not exceeding 25°C).
