

## **Arginine Lysine Polypeptide**

Cat. No. CECP-005

Lot. No. (See product label)

## Introduction

**Description** Arginine Lysine Polypeptide is a 26-peptide SNAP-25 c-terminal mimetic peptide,

which can efficiently inhibit the formation of the SNARE complex and reduce the release of acetylcholine (Ach), thus realizing muscle relaxation. Its mechanism of action still retains the original function of the human body, but only participates in the mechanism of competition, unlike BOTOx, which destroys the body's original functional component SNAP-25 (Neuromuscular Junction (NMJ) vesicle-associated

protein), thus eliminating the safety concerns of the people.

Applications Mainly used in cosmetic products to minimize wrinkles under the eyes and

forehead.

## **Product Information**

Appearance Clarified clear liquid

**Form** Liquid

**CAS No.** 31014-78-5

*pH Stability* 4.5-6.5

**Usage and Packaging** 

**Package** 1kg/bottle

Storage and Shipping Information

**Storage** Keep sealed, shaded and cool.

**Tel:** 1-631-562-8517 1-516-512-3133 **Email:** info@creative-enzymes.com
