Creative Enzymes®

Ecdysteroids

Cat. No. EXTZ-532

Lot. No. (See product label)

Introduction

Description	Ecdysterone is an active substance extracted from the root of the dewgrass plant. It is available in various purities, resulting in white, off-white, light yellow, or light brown crystalline powders. Ecdysterone is widely used in the aquaculture, pharmaceutical, health, and cosmetics industries. It has numerous benefits, such as promoting collagen synthesis, stimulating cell growth, enhancing dermal cell division, and aiding in the removal of cholesterol from the body. Adding ecdysterone to health supplements not only benefits health but is also safe. Additionally, ecdysterone can be used as a raw material in aquaculture to help shrimps and crabs molt in a timely manner, resolve molting issues, and remove harmful parasites, thereby promoting growth and achieving rapid development.
