

Pet postbiotic - helicobacter pylori inhibitor

Cat. No. PSBT-007

Lot. No. (See product label)

Introduction

Description The product has a unique mechanism of killing Helicobacter pylori: Streptococcus lactis and the negative charge carried by the phospholipid bilayer on the surface of Helicobacter pylori cell membrane are combined by electrostatic adsorption, thus destroying the Helicobacter pylori cell membrane structure. It can reduce gastrointestinal flora disorders and mucosal damage, increase the thickness of mucus layer and enhance the mucosal barrier function. In addition, Streptococcus lactis promotes innate immunity and non-specific immune response, raises antibody levels and enhances immune cell activity, boosting self-protection.
