

Liquid probiotics blend for daily formula

Cat. No. PRBT-134

Lot. No. (See product label)

Introduction

Description The skin surface is a complex microbial ecosystem, where surface microorganisms, skin cells, the immune system, and the external environment collectively influence the balance of the skin's microecology. Probiotics can strengthen the skin barrier by producing antimicrobial peptides and enhancing the connections between skin cells, thereby improving the skin's moisturizing ability and resistance to external stimuli. They can also help regulate sebum secretion and maintain the skin's acid-base balance (pH value), which helps reduce the occurrence of skin problems such as acne. An increase in beneficial bacteria can inhibit the growth of pathogenic bacteria. For example, certain probiotics can reduce the number of *Staphylococcus aureus* on the skin, which is of great significance in alleviating skin diseases such as atopic dermatitis. Our Daily Probiotic Blend, composed of carefully selected strains and prebiotics, uses special technology that allows the product to remain stable at room temperature and can be used in combination with other ingredients you desire.

Applications 1% usage can make your product meet expectations
