

Liposomal NMN

Cat. No. EXTZ-709

Lot. No. (See product label)

Introduction

Description

NMN, short for β -nicotinamide mononucleotide, is a naturally occurring bioactive nucleotide that serves as a key metabolic intermediate and the direct precursor for NAD⁺ synthesis, supporting a wide range of physiological functions. Encapsulating NMN within liposomal lipid bilayers markedly elevates its bioavailability, delivering a more powerful and efficient NAD⁺-boosting experience.
