

Xylanase 11A from Podospora anserina, Recombinant

Cat. No. NATE-1522

Lot. No. (See product label)

Introduction

Description Xylanase is the name given to a class of enzymes which degrade the linear

polysaccharide beta-1,4-xylan into xylose, thus breaking down hemicellulose, one of the major components of plant cell walls. As such, it plays a major role in microorganisms thriving on plant sources for the degradation of plant matter into usable nutrients. Xylanases are produced by fungi, bacteria, yeast, marine algae, protozoans, snails, crustaceans, insect, seeds, etc., (mammals do not produce

xylanases).
